Introduction

Welcome to Higgsfield For Dummies

Higgsfield is an AI-native creative suite focused on cinematic image and video generation. It combines proprietary tools such as Soul (image model family), Cinema Studio (filmmaking workspace with real camera and optics controls), Soul ID (character consistency), Marketing Studio, Canvas, and Supercomputer with access to leading external models including Seedance, Kling, Veo, Sora, and others—all under one subscription and credit system.

This guide is written for beginners. It assumes no prior experience with AI video, filmmaking, or prompt engineering. Each chapter provides clear explanations and practical steps so you can move from first generation to consistent, professional results.

REMEMBER

Higgsfield runs entirely in the browser. No local installation or powerful graphics card is required. All generation, editing, and export happen in the cloud.

By the end of this guide you will understand the interface, generate images and cinematic videos, maintain character consistency with Soul ID, use Cinema Studio’s camera controls, manage credits, and apply best practices for efficient workflows.

Chapter 1

Getting Started with Higgsfield

Creating Your Account

Visit higgsfield.ai and sign up. A free tier is available with limited use and watermarks. Paid plans remove watermarks and provide monthly credits.

1. Open higgsfield.ai in a modern web browser.

2. Click Sign Up or Start for Free and register with email or Google.

3. Explore the dashboard and note the available studios and tools.

4. Check your credit balance before generating (displayed before each action).

5. Create a project or use the default workspace to organise assets.

> **TIP**
>
> Start with a clear deliverable in mind (a short social video, product visual, or character test) rather than exploring every model at once.

The Credit System

Generations consume credits based on the model, resolution, and duration. The exact cost is shown on the Generate button before confirmation. Monthly credits reset and do not roll over. Higher plans include more credits and features such as concurrent jobs and, on certain tiers, limited Unlimited mode for selected models.

> **WARNING**
>
> Unused monthly credits typically expire at the end of the billing cycle. Monitor usage carefully, especially with premium models that consume higher credit amounts.

Chapter 2

Image Generation with Soul and More

Higgsfield offers both its proprietary Soul family (optimised for cinematic, fashion, and culture-native aesthetics) and a library of external image models such as Nano Banana, GPT Image, Seedream, and others.

Generating Your First Image

1. Select the Image tool or Soul Cinema from the dashboard.

2. Choose a model (Soul for cinematic look, or another for specific strengths).

3. Write a detailed prompt including subject, setting, lighting, and style.

4. Set aspect ratio and resolution.

5. Review the credit cost and generate.

6. Iterate with variations or move to editing tools.

> **TIP**
>
> Soul models excel at textured, film-like stills. Use reference images when you need precise control over composition or colour (Soul HEX for palette consistency).

Chapter 3

Cinema Studio and Video Creation

Cinema Studio is Higgsfield's flagship filmmaking workspace. It provides real optical controls (camera body, lens, focal length), multi-axis motion, start/end frames, Elements for reusable assets, and access to multiple video models. Versions include advanced features such as AI Director and longer clips.

Basic Video Workflow

1. Open Cinema Studio.

2. Select a video model (Kling, Seedance, Veo, etc.).

3. Choose camera and motion presets or describe them in the prompt.

4. Provide a text prompt and/or reference images or start/end frames.

5. Generate and review. Use Elements to lock characters or locations across shots.

REMEMBER

Cinema Studio is designed for intentional filmmaking rather than one-shot generation. Use camera controls and Elements for consistent multi-shot sequences.

Chapter 4

Characters, Soul ID, and Consistency

Soul ID allows you to train a character once from photos or a guided process. The same face and identity can then be reused across images and videos, reducing drift between generations.

1. Open the Character or Soul ID / AI Influencer tool.

2. Upload reference photos or generate initial views.

3. Train or save the character.

4. Reference the character (via Elements or tags) in subsequent Cinema Studio or image prompts.

5. Generate multiple shots and verify consistency.

> **TIP**
>
> For series work or AI influencers, create the character early and lock it into Elements so every new scene inherits the same identity.

Chapter 5

Marketing Studio, Canvas, and Advanced Tools

Marketing Studio

Marketing Studio converts a product URL or image into finished video ads (UGC, unboxing, tutorial, or TV-spot styles) with audio and lip sync options.

Canvas and Supercomputer

Canvas provides a node-based board for chaining models and saving reusable workflows. Supercomputer acts as an agent that plans and delivers multi-asset projects from a plain-language description. MCP/CLI integrations allow generation from external agents such as Claude.

Other Tools

Additional features include Lipsync Studio, visual effects presets, Genjutsu for motion transfer, upscaling, and audio tools for voiceover and cloning.

Chapter 6

Pricing, Credits, and Best Practices

As of 2026, Higgsfield offers Free, Starter, Plus, Ultra, and Team plans. Pricing and credit allotments change; always verify the live page at higgsfield.ai/pricing.

Plan	Approx. Monthly	Credits / month	Notes
Starter	$19	270	Entry paid tier
Plus	$59 / $47 annual	1,200	Popular mid-tier
Ultra	$129 / $99 annual	3,000+	Higher volume
Team	From ~$65–79/seat	Pooled	Collaboration

Approximate figures as of late 2026. Credit costs vary significantly by model.

Best Practices

• Begin on the free tier to test models before committing.

• Always check the credit cost preview before generating.

• Use Soul ID and Elements for any multi-shot or series work.

• Prefer Cinema Studio camera presets for more intentional motion.

• Organise work in projects and save reusable Canvas workflows.

• Verify commercial use rights on your plan.

• Watch for model and pricing updates, as both evolve frequently.

WARNING

Premium models (Veo, Sora, high-resolution Seedance) consume far more credits than efficient ones such as certain Kling or lower-resolution options. Plan your budget accordingly.

Appendix A

Glossary of Terms

Cinema Studio: Higgsfield's cinematic video workspace with camera, lens, motion controls, and Elements.

Soul / Soul Cinema: Proprietary image model family optimised for cinematic and aesthetic stills.

Soul ID: Character consistency system that locks a face and identity across generations.

Elements: Reusable assets (characters, locations, props) that can be locked into scenes.

Credits: Consumption unit for generations; cost depends on model, resolution, and length.

Canvas: Node-based workflow board for chaining models and saving templates.

Marketing Studio: Tool for generating product and UGC-style video ads from a URL or image.

Supercomputer: Agent that plans and delivers multi-asset projects from natural language.
